

Angular Fundamentals

Module – Component Trees

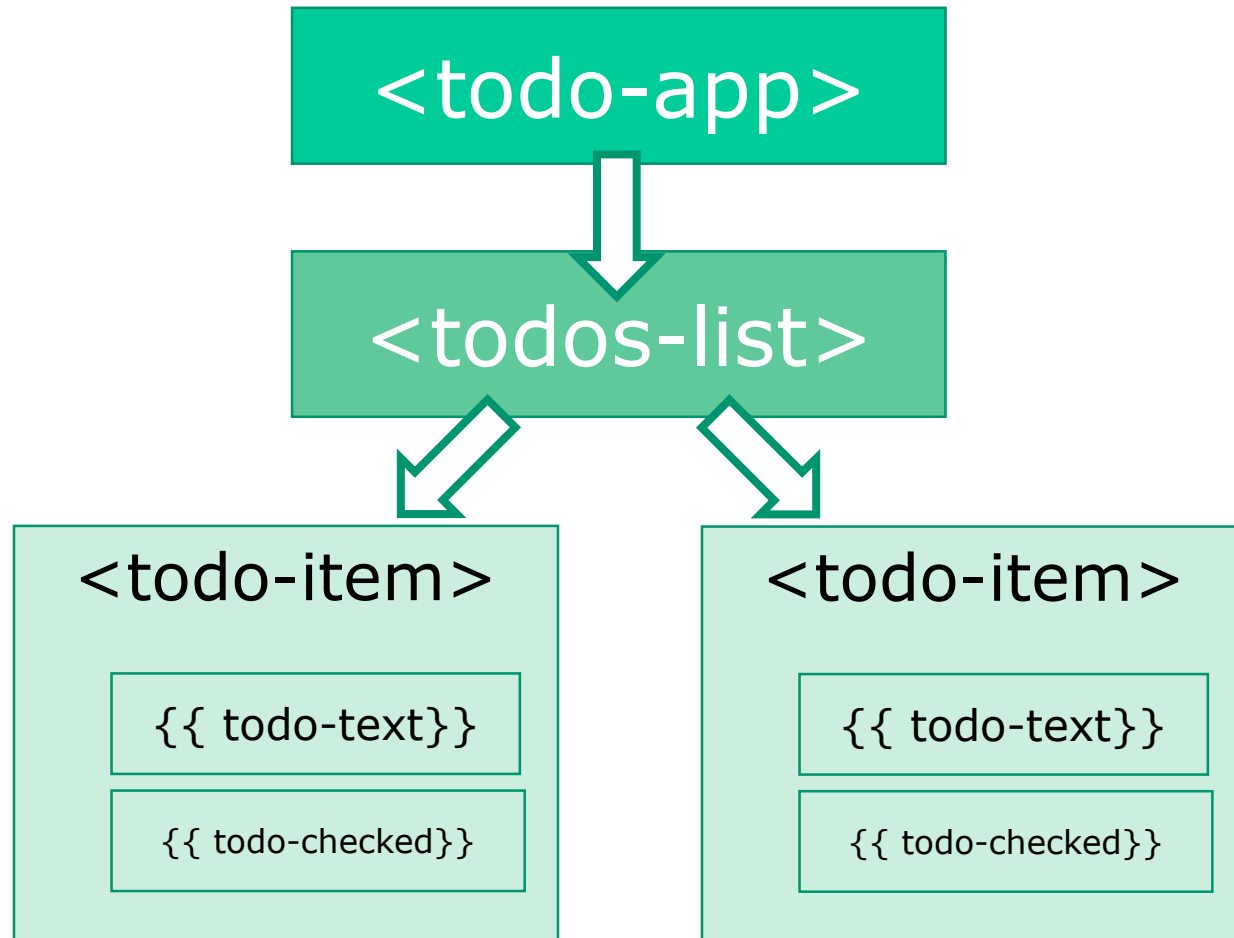

Peter Kassenaar
info@kassenaar.com

Hoofdstuk 7
p. 182 en verder

Angular-app: Tree of components

Application as a tree of components

- Multiple components?

1. Create files manually – or let CLI handle this for you

1. `ng generate component <component-name>`

2. `ng g c <component-name>`

2. Import in module – or (again) let CLI take care of this for you

3. Add to declarations : [...] section of `@ngModule`.

4. Add via HTML to `parent-component`

- Repeat for every component

1. Detailcomponent toevoegen

```
// city.detail.ts
import { Component } from '@angular/core';

@Component({
  selector: 'city-detail',
  template: `
    <h2>City details</h2>
    <ul class="list-group">
      <li class="list-group-item">Naam: [naam van stad]</li>
      <li class="list-group-item">Provincie: [provincie]</li>
      <li class="list-group-item">Highlights: [highlights]</li>
    </ul>
  `
})

export class CityDetail{
}
```

Nieuwe selector

Nog in te vullen

2. Injection in Module

// Angular Modules

...

// Custom Components

```
import {AppComponent} from './app.component';  
import {CityDetail} from './city.detail';  
import {CityService} from './city.service';
```

Nieuwe
component

// Module declaration

```
@NgModule({  
  imports      : [BrowserModule, HttpClientModule],  
  declarations: [AppComponent, CityDetail],  
  bootstrap   : [AppComponent],  
  providers    : [CityService]  
})  
export class AppModule {  
}
```

Toevoegen aan
declarations: []

3. Insluiten in HTML

```
<!-- app.html -->  
<div class="row">  
  ...  
  <div class="col-md-6">  
    ...  
    <city-detail></city-detail>  
  </div>  
</div>
```

Combineren met overige
HTML

4. Resultaat

Cities via een service

Mijn favoriete steden zijn :

| |
|---------------|
| 1 - Groningen |
| 2 - Hengelo |
| 3 - Den Haag |
| 4 - Enschede |
| 5 - Heerlen |
| 6 - Mechelen |

City details

| |
|--------------------------|
| Naam: [naam van stad] |
| Provincie: [provincie] |
| Highlights: [highlights] |

Nog in te vullen

Doel: details van geselecteerde city tonen in
child-component

Data flow tussen componenten

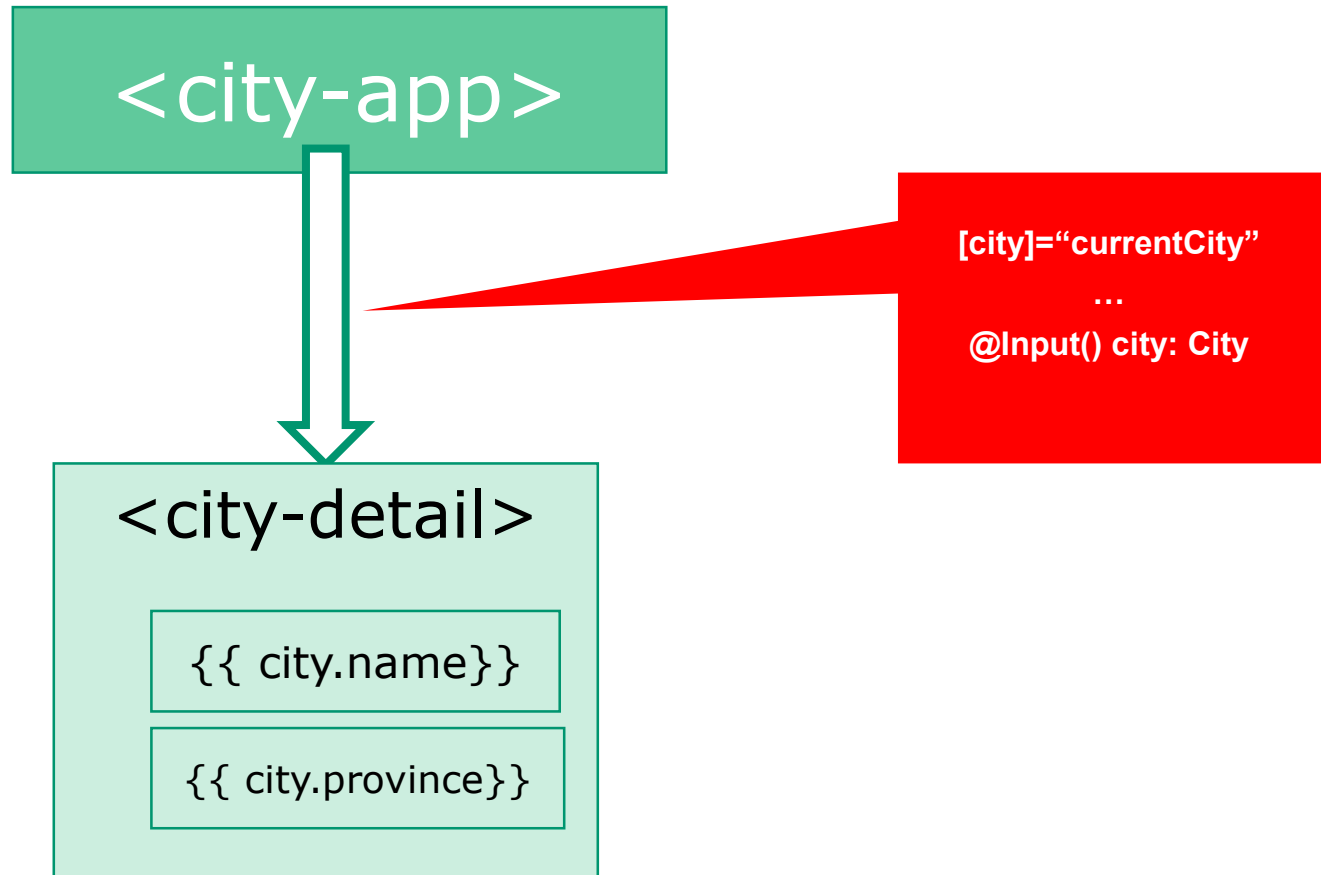

Werken met inputs en outputs

Data flow tussen components

*"Data flows in to a component via
@Input() 's"*

*Data flows out of a component via
@Output() 's"*

Parent-Child flow: de annotatie @Input()

Werken met @Input()

1. Service `Input` importeren in de betreffende component
2. Decorator `@Input()` gebruiken in de class definition

```
// city.detail.ts
import { Component, Input } from '@angular/core';
import { City } from "../city.model";
```

```
@Component({
  ...
})
```

```
export class CityDetail {
  @Input() city: City;
}
```

Input

Parent Component aanpassen voor @Input

```
<!-- app.html -->
<div class="row">
  <div class="col-md-6">
    ...
    <ul class="list-group">
      <li *ngFor="#city of cities" class="list-group-item"
        (click)="getCity(city)">
        {{ city.id }} - {{ city.name }}
      </li>
    </ul>
    <button *ngIf="currentCity" class="btn btn-primary"
      (click)="clearCity()">Clear</button>
  </div>
  <div class="col-md-6">
    <div *ngIf="currentCity">
      <city-detail [city]="currentCity"></city-detail>
    </div>
  </div>
</div>
```

Aanpassing

Aanpassing!

Parent Component Class uitbreiden

```
export class AppComponent {  
    // Properties voor de component/class  
    public cities:City[];  
    public currentCity:City;  
  
    ...  
  
    getCity(city) {  
        this.currentCity = city;  
    }  
  
    clearCity() {  
        this.currentCity = null;  
    }  
  
    ...  
}
```

Resultaat

Cities via een service

Mijn favoriete steden zijn :

1 - Groningen

2 - Hengelo

3 - Den Haag

4 - Enschede

5 - Heerlen

6 - Mechelen

Clear

City details

Naam: Enschede

Provincie: Grote Markt

Highlights: Twentse Welle museum

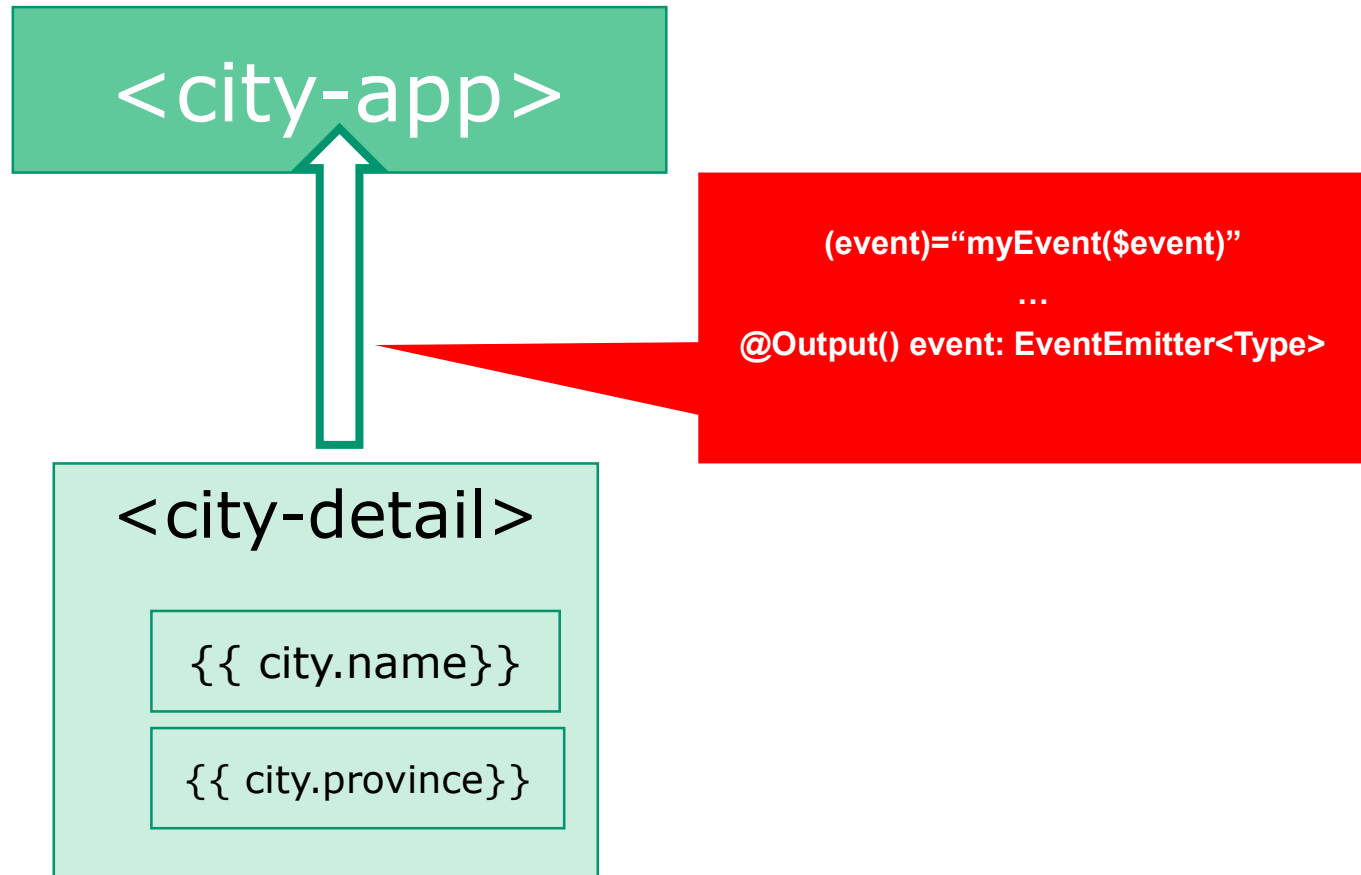

Checkpoint

- Componenten kunnen binnen componenten worden opgenomen
- Breidt de HTML van de Parent Component uit met declaratie van de Child Component
- Denk er aan Child Component te importeren in de `@NgModule`
- Data flow naar Child Component : werken met `@Input()` en `[propName]="data"`
- Oefening: 6b) en 6c)
- Voorbeeld: [/300-components](#)

Oefening....

Child-Parent flow: de annotatie @Output ()

Werkwijze – idem, maar dan andersom

1. Functie `Output` importeren in de betreffende component
2. Decorator `@Output()` gebruiken in de class definition
3. `EventEmitter` definiëren en zijn Type Annotation

*“With @Output,
data flows up the Component Chain”*

Een rating geven aan Cities

```
// city.detail.ts
```

```
import { Component, Input, Output, EventEmitter } from '@angular/core';
```

```
@Component({
```

```
  ...
```

```
  template: `
```

```
    <h2>City details
```

```
      <button (click)="rate(1)">+1</button>
```

```
      <button (click)="rate(-1)">-1</button>
```

```
    </h2>
```

```
  ...
```

```
})
```

```
export class CityDetail {
```

```
  @Input() city: City;
```

```
  @Output() rating: EventEmitter<number> = new EventEmitter<number>();
```

```
  rate(num) {
```

```
    console.log('rating voor ', this.city.name, ': ', num);
```

```
    this.rating.emit(num);
```

```
  }
```

```
}
```

Imports

Bind custom
events to DOM

Define & handle
custom
@Output event

Parent Component voorbereiden op ontvangen custom event

```
<!-- app.html -->  
<div *ngIf="currentCity">  
  <city-detail [city]="currentCity" (rating)="updateRating($event)">  
  </city-detail>  
</div>
```

Capture
event

```
// app.component.ts  
  
// increase or decrease rating on Event Emitted  
updateRating(rating){  
  this.currentCity.rating += rating;  
}
```

Rating tonen in HTML

```
<li *ngFor="let city of cities"  
  class="list-group-item" (click)="getCity(city)">  
  {{ city.id }} - {{ city.name }} ({{i}})  
  <span class="badge">{{city.rating}}</span>  
</li>
```

Rating

Resultaat

Cities via een service

Mijn favoriete steden zijn :

| | |
|---------------|----|
| 1 - Groningen | 0 |
| 2 - Hengelo | 0 |
| 3 - Den Haag | -3 |
| 4 - Enschede | 0 |
| 5 - Heerlen | 2 |
| 6 - Mechelen | 5 |

Clear

City details +1 -1

Naam: Den Haag

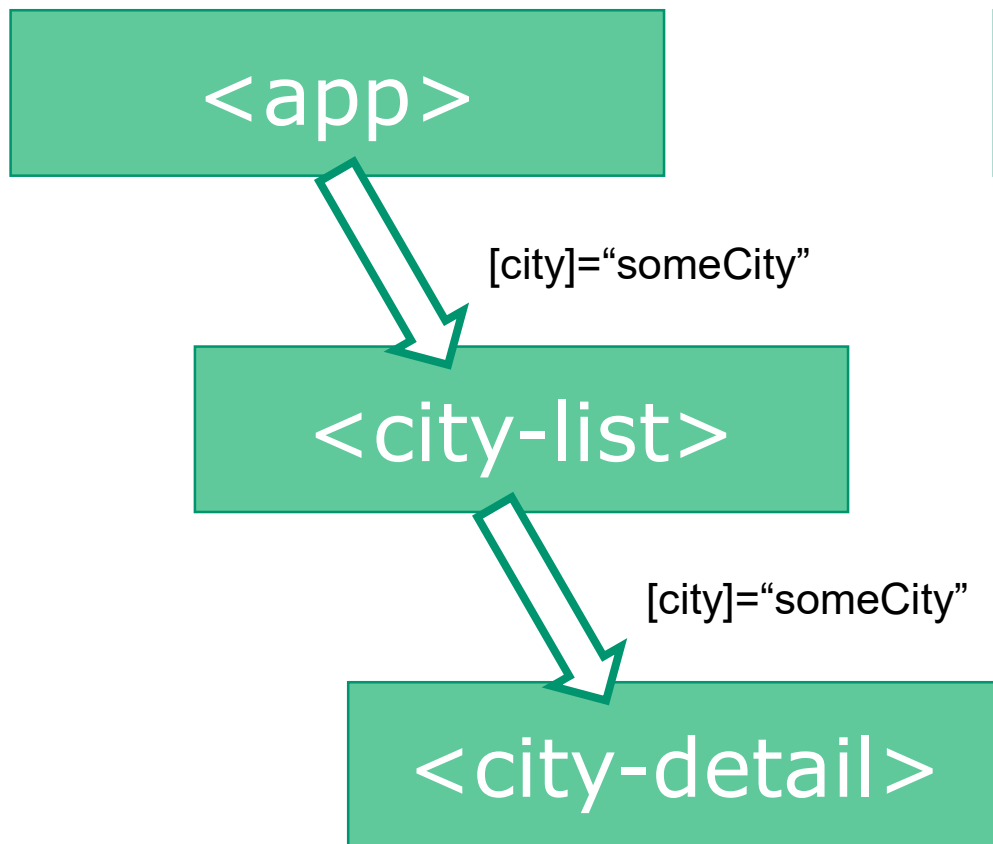

Provincie: Zuid-Holland

Highlights: Binnenhof

Samenvatting

Parent → Child

Child → Parent

Checkpoint

- Data flow naar Parent Component : werken met `@Output()` en `(eventName)="eventHandler($event)"`
- Je kunt *elk type* data uitsturen via de `EventEmitter`.
- Oefening: 6d)
- Voorbeeld: `/302-components-output`
- Meer info: <https://vsavkin.com/the-core-concepts-of-angular-2-c3d6cbe04d04>

Oefening....

Sibling communication

Geen directe parent-child relatie

Communicatie tussen siblings

- via `Output()` van een `childcomponent`, naar een `@Input()` van andere `childcomponent`

Mooiere oplossing – Pub/Sub-systeem met Observables

- <http://www.syntaxsuccess.com/viewarticle/pub-sub-in-angular-2.0>

“Custom events,
gebruik een event bus”

Event bus

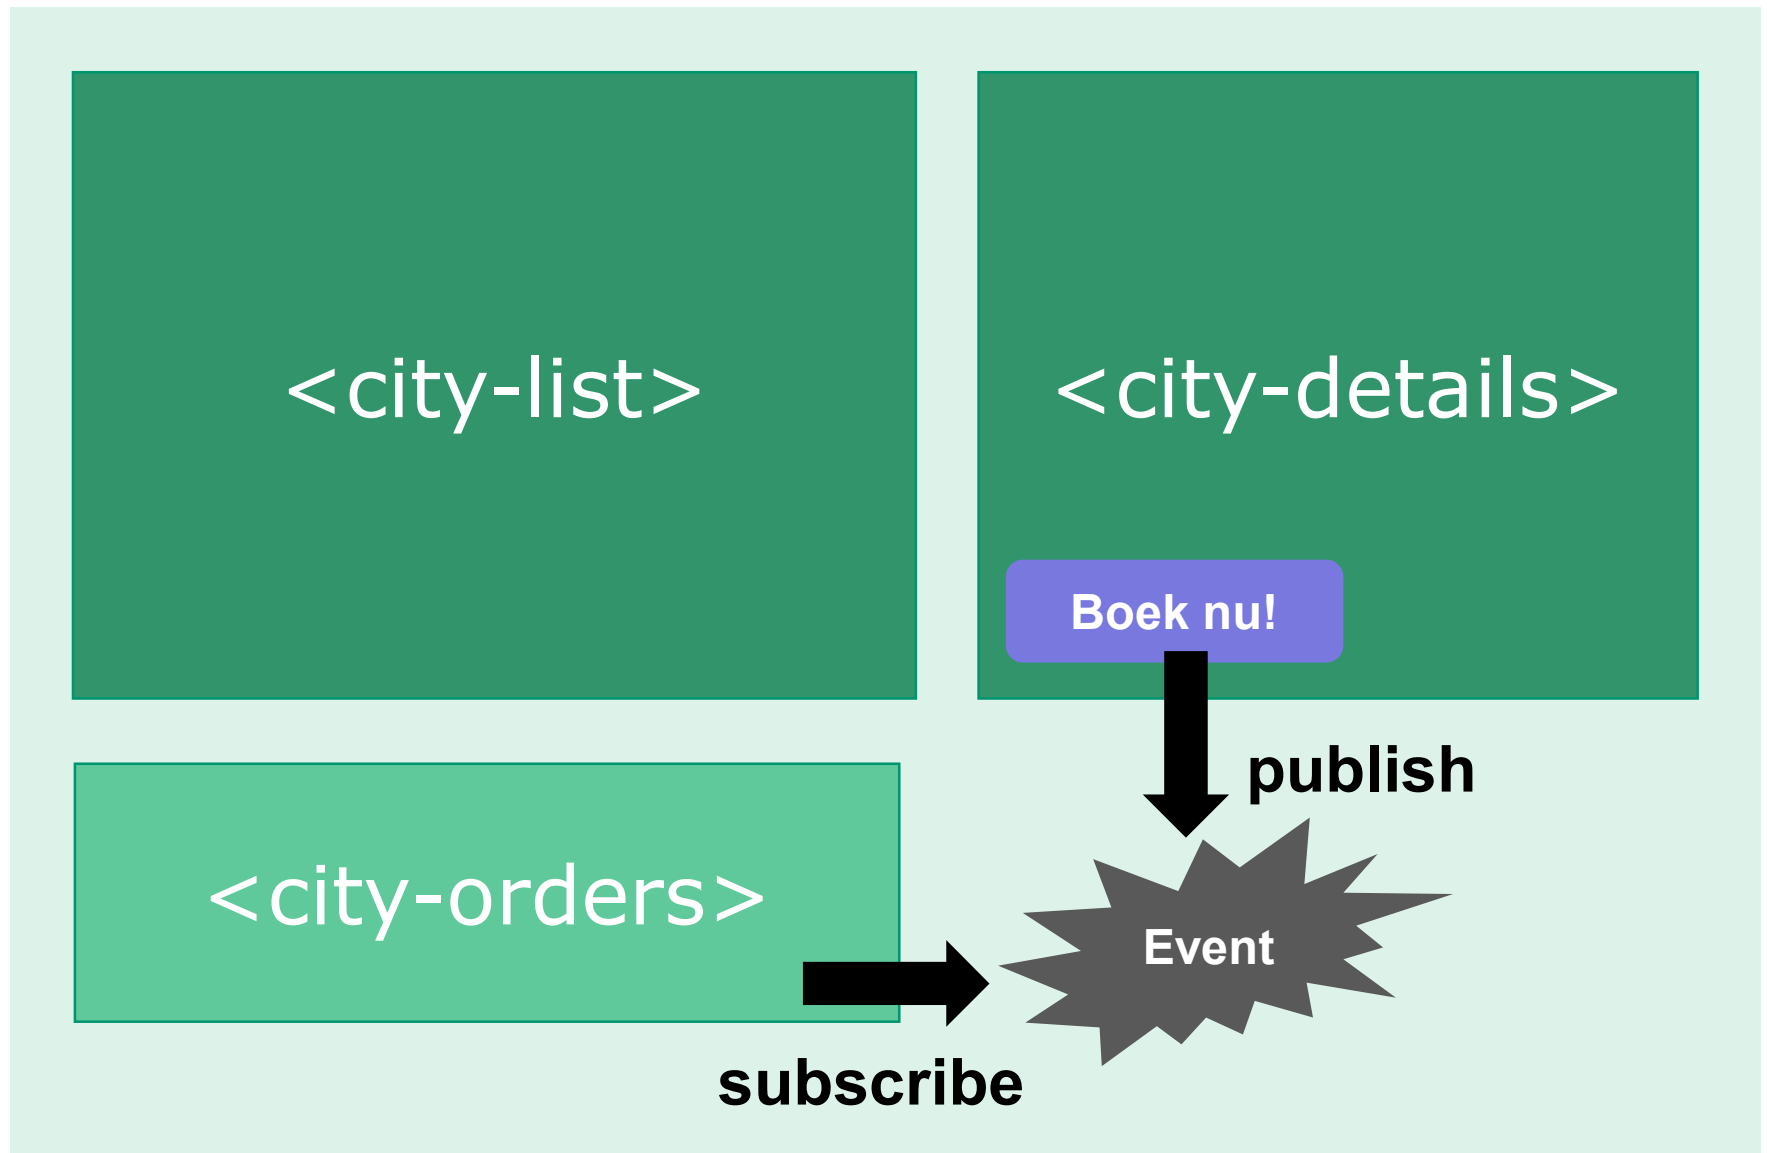

Opties

Uit RxJs-bibliotheek, werken met:

- `EventEmitter()`
- `Observable()`
- `Observer()`
- `Subject()` (zowel `Observable` als `Observer`)

"Publish en Subscribe" – PubSub systeem

PubSub-service maken

- Stap 1 – Publicatie service maken
- Stap 2 – 'Producer', of 'Publish' – component maken
- Stap 3 – subscriber-component maken, of toevoegen aan bestaande component.

1. OrderService

```
// order.service.ts

import {Subject} from "rxjs/Subject";
import {Injectable} from "@angular/core";
import {City} from "../model/city.model";

@Injectable()
export class OrderService {
    Stream:Subject<City>;

    constructor() {
        this.Stream = new Subject<City>();
    }
}
```

2. Producer component ('boek nu'-knop)

In de HTML:

```
<h2>Prijs voor een weekendje weg:
{{ city.price | currency:'EUR':true:'1.2' }}
<button class="btn btn-lg btn-info"
  (click)="order(city)">Boek nu!</button>
</h2>
```

In de class:

```
// Order plaatsen. Event emitten voor deze stad.
// Dit gaan opvangen in city.orders.ts
order(city) {
  console.log(`Stedentripje geboekt voor: ${this.city.name}`);
  this.orderService.Stream.next(city);
}
```

3. Subscriber component

```
//city.orders.ts - Een soort 'winkelmandje',  
// bijhouden welke stedentripjes zijn geboekt.
```

```
import ...
```

```
@Component({  
  selector: 'city-orders',  
  template: `  
    <div *ngIf="currentOrders.length > 0">  
      ...  
    </div>  
  `,  
})
```

```
export class CityOrders {  
  ...  
  ngOnInit() {  
    this.orderService.Stream  
      .subscribe(  
        (city:City) => this.processOrder(city),  
        (err)=>console.log('Error bij verwerken City-order'),  
        ()=>console.log('Complete...')  
      )  
  }  
  ...  
}
```

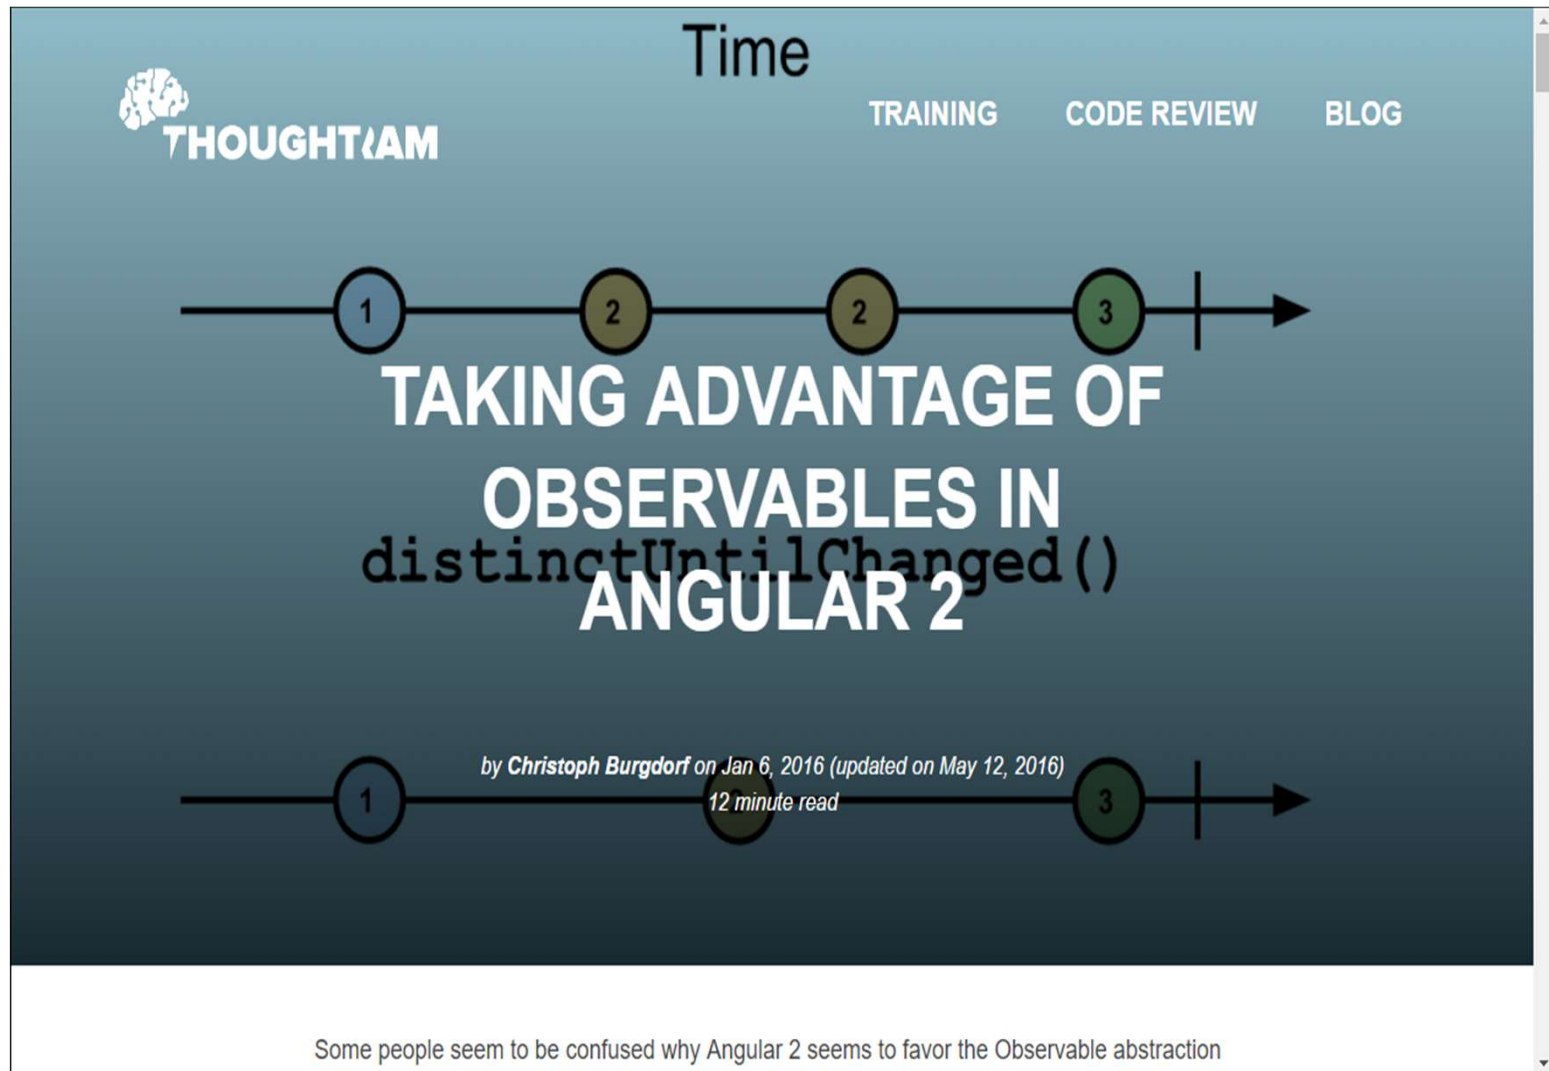

Checkpoint

- Event Bus : 'onzichtbaar' werken met Streams en Subject
- Er zijn opties voor het werken met Observable Streams.
- Voorbeeld: \303-pubsub-ordercomponent
- Oefening 6e) e-commerce applicatie maken.

Oefening....

Meer over Observables

Angular 2 Observable Data Services

Nov 17, 2015

Updated May 6, 2016 - 8 min read

Angular 2 brings many new concepts that can improve our JavaScript applications. The first new concept to Angular is the use of Observables. Observables are a proposed feature for ES2016 (ES7). I won't go in depth into Observables but will just cover some of the high level concepts. If you want an introduction to Observables check out my screen cast.

INTRO TO RXJS OBSERVABLES AND ANGULAR 2

The rest of this post will cover more data and application state management in a Angular 2 application. At the time of this writing Angular is on version [Beta 1](#). This post has been updated as of [Beta 15](#). The syntax of how Observables and their

Observables In Angular 2.0

Author: [Torgeir Helgevold](#)

Published: Wed Jan 06 2016

Viewed 3375 times

The RxJs community has presented the idea that any series of events can be modeled as one or many asynchronous or synchronous arrays. In the following post I want to explore this by modeling a series of different user inputs as Observables.

I am still learning about Observables and their potential, but I figured it would be interesting to implement a custom text editor, from scratch, using Observables to represent keyboard and mouse events.

Building a perfect text editor is not really the point here, but I want to see if there is any added value from looking at input sequences as Observables. The first step when building a text editor is identifying which input events to support. In my sample I have decided to focus on adding the ability to input and delete characters. Currently I have limited the input
